

# Feedback 3rd December - Frontend Dev

Overall feedback is great first iteration!

Couple of main things across the whole app, is can we check what font is being used please, I think this might be a slightly thicker version of the font we'd like to use? Also can we see the branding on it just to see how it fits graphically in the nav bar.

## Home Page Carousel

### Functionality

- On mobile its fine having them so close. Need to think about long team names. On web the name and badges should be on the outer part of the component like in the designs.
- When logged in as premium user the predictions stay scrambled. Please can also put the blur on top of them for free users when they are scrambled just like the match cards.

### Styling

- Missing live icon (red live icon)
- The central dash in between the scores moves around for different scores, why is this? The values move even though to me the boxes that numbers sit within should be in the same place?

## Match Cards

### Functionality

- Here the functionality is exactly what we wanted, tested on mobile and web and appears to mask perfectly

## Styling

Is in the right realm, but needs quite a few changes as they look really long and thin compared to the designs. Means on mobile you get 1 card at best. Ideally it would be 2 or at a minimum 1.5.

- The grey box that each prediction is in should match the colour of the card (white). There should also be no padding between these boxes, at the moment the card is way too long (looks thin and stretched compared to the designs)
- The cards appear to have an outline? On the designs the cards are white and sit inside a larger grey box, they simply have a slight shadow all around. Please keep the increase in shadow as you hover over that you currently have but remove this outline and put the cards inside this larger grey box
- Missing divider line between the scores and the first prediction
- please also amend the api call for this to simply call this endpoint: `{{base_url}}/api/v1/fixtures` this should be the primary one. Each fixture as well that is shown in the first 6 will have a field called `number_of_predictions: int` please use this for the 3 out X section
- Reduce the white space at the bottom of the third prediction between it and the divider line

## Smart Combo

### Functionality

- Looks fine functionality wise, see more button doesn't work and smart combo page is missing?

### Styling

- This one looks more narrow than the designs. Maybe we need to scale down the match cards? As the text also looks smaller to the eye? might be because they are more compressed hence appear smaller
- Same thing as the cards regarding being on a greyer background, the box itself should be white and then a shadow around it. At the moment it looks like it has a border.

- The 72% accuracy last week should be in its own grey box as per designs, remove the divider line
- Reduce the amount of blue space above and below "smart combo" text
- Move the gradient more the left, so it should be more pushed towards the left, looks at the moment like it is just 50-50 gradient, the designs show it being centered to the top left corner.

## Players to watch

### Functionality

- On web it loads with the right dummy skeleton, then the player boxes expand such that you have two per screen instead of the square shape?
- On mobile can we have swiping enabled rather than having to click the buttons

### Styling

- There is a weird gap difference at the top between the loading state and the populated state. Where the blue space around the "player watchlist" moves and it looks really strange

## Matches (search page)

### Functionality

- On mobile in particular when we load this page can we remove the "Matches" text, it doesn't appear on web and don't want it here (apologies as I know its on the designs)
- I also noticed that even when we are toggled to live matches, we can make further spam api calls by going through the dates. Ideally this isn't possible

### Styling

- Same here should be grey background with white cards and a shadow
- The VS text is not centered with the lines next to it, they all should be black and the lines should also have a fade.

## Pricing Page

Not much to say here looks exactly as is. Only can the weekly button be at the same level, so padded from the bottom up rather than text down. Such that it is always inline with the monthly.

Also this page needs to call `{{base_url}}/api/v1/payments/subscription-pricing` to obtain the values and currency to display. This uses cloudflare to detect the incoming ip address and populate it accordingly depending upon the country. It will throw an error when the country is not supported (can test this with india, as its not supported)

## Individual Match Page

### Functionality

- For some reason the text in the banner at the top is huge compared to the home screen, ideally these things shouldn't change as its a similar component
- On mobile the nav bar between predictions, stats, commentary etc is not scrollable so it makes the page not fit the screen size. You can then move around horizontally which is weird.
- The nav bar should be inline with the filter button and be scrollable
- Weather does not work and fit on mobile (pretty sure you mentioned this one), should be scrollable

### Styling

- No grey background this time, but please remove the outline and add a shadow
- As discussed only blue for one that will have an `is_featured` flag alongside it
- Too much white space between the title of the prediction and the % value when they are closed
- Weather as discussed should be rounded at the bottom and can the corners of the main rectangle box be more rounded
